

CLAIMS

- SB
a1
1. A rotor for an electric motor, comprising:
a magnet having a rotation axis, said
magnet being provided with a through hole extending
coaxially with said rotation axis;
a shaft fixed concentrically to said
magnet, said shaft including a portion fitted in said
through hole, said portion having an axial
interengagement length shorter than an axial length of
said through hole; and
reinforcing means provided at least inside
said through hole for ensuring a fixing force to securely
hold said shaft in a predetermined position in said
magnet.
2. A rotor as set forth in claim 1, wherein said
magnet comprises an annular magnet material and a coating
formed on a surface of said magnet material at least
inside said through hole, and wherein said reinforcing
means comprises said coating, said portion of said shaft
being engaged with said coating in a face-to-face manner.
3. A rotor as set forth in claim 2, wherein said
coating is made of a metal plating.
4. A rotor as set forth in claim 3, wherein said
metal plating is an electroless plating.
5. A rotor as set forth in claim 3, wherein said
metal plating includes at least one of a Ni-P electroless
plating, a Ni-B electroless plating and a Ni-P-W
electroless plating.
6. A rotor as set forth in claim 3, wherein said
metal plating has a thickness of at least 10 μm .
7. A rotor as set forth in claim 3, wherein said
metal plating includes an electroless plating base layer
and an electroplating top layer.
8. A rotor as set forth in claim 7, wherein said
electroplating top layer is a Ni electroplating.
9. A rotor as set forth in claim 7, wherein said
electroless plating base layer has a thickness in a range
- SB
a2

of 0.5 μm to 2.0 μm .

10. A rotor as set forth in claim 7, wherein said electroplating top layer has a thickness of at least 3.0 μm .

5 11. A rotor as set forth in claim 3, wherein said magnet material is made of a bonded magnet material.

12. A rotor as set forth in claim 11, wherein a dimensional relationship between said axial interengagement length of said portion of said shaft and said axial length of said through hole is defined as $T/5 \leq t \leq T/2$, in which "T" is said through hole axial length and "t" is said axial interengagement length.

13. A rotor as set forth in claim 11, wherein said portion of said shaft is tightly press-fitted in said through hole of said magnet, and wherein an interference of said portion in said through hole is in a range of 5 μm to 30 μm .

14. A rotor as set forth in claim 11, wherein said bonded magnet material is vacuum-impregnated with a bonding agent or filler.

15. A rotor as set forth in claim 1, wherein said reinforcing means comprises an adhesive filled in a clearance defined between a remainder of said shaft other than said portion and said magnet inside said through hole.

16. A rotor as set forth in claim 15, wherein a dimensional relationship between said axial interengagement length of said portion of said shaft and said axial length of said through hole is defined as $T/5 \leq t \leq 4T/5$, in which "T" is said through hole axial length and "t" is said axial interengagement length.

17. A rotor as set forth in claim 15, wherein said adhesive is made of a thermosetting epoxy resin.

18. A rotor as set forth in claim 15, wherein said magnet comprises an annular magnet material and a coating formed on a surface of said magnet material at least

As
cont.

inside said through hole, and wherein said reinforcing means further comprises said coating, said portion of said shaft being engaged with said coating in a face-to-face manner.

5 19. A rotor as set forth in claim 18, wherein said coating is made of a metal plating.

20. A rotor as set forth in claim 18, wherein said coating is made of an organic substance layer.

10 21. A rotor as set forth in claim 18, wherein said magnet material is made of a bonded magnet material.

22. A rotor as set forth in claim 1, wherein said magnet contains rare-earth elements.

23. Method of producing a rotor for an electric motor, comprising the steps of:

Sub
File

15 forming a coating on a surface of an annular magnet material and thereby providing a magnet having a rotation axis and a through hole extending coaxially with said rotation axis, said coating being arranged at least inside said through hole;

20 providing a shaft including a portion capable of being fitted in said through hole; and inserting said shaft into said through hole of said magnet and tightly press-fitting said portion of said shaft in said through hole, until an axial interengagement length of said portion, shorter than an axial length of said through hole, is obtained.

25 24. A method as set forth in claim 23, wherein said magnet material is made of a bonded magnet material, wherein said coating is a metal plating, and further including a step of vacuum-impregnating said bonded magnet material with an adhesive before said step of forming said coating.

30 25. A method as set forth in claim 23, wherein an interference of said portion in said through hole is adjusted by changing a thickness of said coating.

35 26. Method of producing a rotor for an electric motor, comprising the steps of:

Sub
a7
Sub
a7

5 *Sub B3 cancelled.*
providing a magnet having a rotation axis and a through hole extending coaxially with said rotation axis;

providing a shaft including a first portion capable of being fitted in said through hole and a second portion axially adjacent to said first portion for defining a clearance inside said through hole;

10 inserting said shaft into said through hole of said magnet and fitting said first portion of said shaft in said through hole, until an axial interengagement length of said first portion, shorter than an axial length of said through hole, is obtained; and

15 filling an adhesive in said clearance inside said through hole.

27. A method as set forth in claim 26, wherein said adhesive is vacuum-impregnated into said clearance.

20 28. A method as set forth in claim 26, wherein said magnet is made of an annular bonded magnet material, and further including a step of forming a coating on a surface of said bonded magnet material before said step of inserting said shaft.
